VPixx setup (first try)

Checking VPixx functioning after connecting it to PC and CRT for first time

2023-10-05 notes

I connected the Datapixx and the CRT monitor to the grogu PC today (and to each other, of course). I also connected the IR emitter.

I had to make a link to make a `Datapixx.mex` file. I chose `Datapixx_octave5.mex`.

VPixx (3DPixx) system seems to be working: I can see `ImagingStereoDemo(1,1)` (which uses the Datapixx option).

However, the LCD glasses flicker strongly; very noticeably. I think this must be because the CRT monitor is still using its default setting: 75Hz. I set the resolution to be 1600×1200 using the Xubuntu settings.

I looked over the old VNLab notes about xrandr and edid, but I think what I really need is a copy of the boots PC's xorg.conf file. I think the only HDD that might have this is the one labeled "tarballs." I'll have to check this later.

- Yes, the `/tarballs` HDD contains a file `boots.tar.gz`.

Let's copy this to grogu, unzip it, and hope it has an xorg.conf file.

PTB VBLSyncTest

<2023-10-05>

Looks good:

```
>> VBLSyncTest

PTB-INFO: This is Psychtoolbox-3 for GNU/Linux X11, under GNU/Octave 64-Bit
(Version 3.0.18 - Build date: Jan 20 2022).

and commercial services, please type
PTB-INFO: 'PsychPaidSupportAndServices'.

PTB-INFO: Connected to Advanced Micro Devices, Inc. [AMD/ATI] Polaris 20 XL
[Radeon RX 580 2048SP] GPU with DCE-11.0 display engine [6 heads].

PTB-INFO: OpenGL-Renderer is AMD :: AMD Radeon RX 580 2048SP (polaris10, LLVM
15.0.7, DRM 3.49, 6.2.0-34-generic) :: 4.6 (Compatibility Profile) Mesa
23.0.4-0ubuntu1~22.04.1
PTB-INFO: VBL startline == 1080 , VBL Endline == 1123
PTB-INFO: Measured monitor refresh interval from beamposition == 16.666957 ms
[59.998954 Hz].
PTB-INFO: Will try to use OS-Builtin OpenML sync control support for accurate
Flip timestamping.
PTB-INFO: Measured monitor refresh interval from VBLsync == 16.666918 ms
[59.999096 Hz]. (50 valid samples taken, stddev==0.000469 ms.)
PTB-INFO: Reported monitor refresh interval from operating system == 16.666667
ms [60.000000 Hz].
PTB-INFO: Small deviations between reported values are normal and no reason to
worry.
The refresh interval reported by the operating system is 16.66667 ms.
libptbdrawtext_ftgl: External 'DrawText' text rendering plugin initialized.
libptbdrawtext_ftgl: Maximum number of cacheable fonts is 40, minimum number
of supported concurrent windows is 10.
libptbdrawtext_ftgl: This plugin uses multiple excellent free software
libraries to do its work:
libptbdrawtext_ftgl: OGLFT (http://oglft.sourceforge.net/) the OpenGL-FreeType
library.
libptbdrawtext_ftgl: The FreeType-2 (http://freetype.sourceforge.net/)
library.
libptbdrawtext_ftgl: The FontConfig (http://www.fontconfig.org) library.
libptbdrawtext_ftgl: Thanks!

Measured refresh interval, as reported by "GetFlipInterval" is 16.66692 ms.
(nsamples == 0, stddev == 0.00000 ms)
PTB missed 0 out of 600 stimulus presentation deadlines.
One missed deadline is ok and an artifact of the measurement.
PTB completed 0 stimulus presentations before the requested target time.
Have a look at the plots for more details...
```

Setting CRT to 120Hz refresh rate

2023-10-06 notes

Added a second user account, "user2"

ADC did this to prevent getting locked out of grogu if something goes wrong when he tries to reconfigure xorg.conf on his account (anthony).

Login: user2

For password, see ADC

Created new xorg.conf file

Automatically generated xorg.conf.new file

Followed this advice:
https://unix.stackexchange.com/questions/146842/regenerate-xorg-conf-with-current-settings

When not running X server (I logged into rescue mode root shell), do this:

```
$ Xorg -configure > xorg.conf.new
```

The contents of the automatically generated file:

```

2023-10-09 notes

xrandr command line

Was able to change the display mode (both resolution and refresh rate) by doing this from command line, *after* putting the modified xorg.conf file in place at `/etc/xorg.conf`. (However, I later determined that the presence of an xorg.conf file is not necessary for the xrandr commands to work.)

```
xrandr --newmode "800x600_120.00"   83.00  800 856 936 1072  600 603 607 646 -
hsync +vsync
xrandr --addmode DVI-D-0 800x600_120.00
xrandr --output DVI-D-0 --mode 800x600_120.00
```

I was able to get both 1280×768 and 800×600 resolutions. (I can't tell for sure what the refresh rates were.) These modes, and the refresh rates that I wanted to associate with them, were available on the pull down menu accessible from the "Settings → Display" menu.

PTB Sync errors

However, PTB gave me nothing but errors. Couldn't run ImagingStereoDemo, nor VBLSyncTest, nor GarboriumDemo.

I tried turning off the SkipSyncTest (or similar name) procedures, but this just made Octave hang even worse, so I turned them back on.

To get PTB to work, I had to change the name of both versions of xorg.conf.new that I had moved to `/etc/` back to their original names, so that there wasn't any `xorg.conf` file present in `/etc/`. I tried moving both `xorg.conf.new` (the file that I had Xorg -configure generate automatically) and `xorg.conf.new.1284x768_120.00` (the file that I edited from `xorg.conf.new` to include the new mode indicated in its file name); both caused errors.

xorg.conf.new.SIMPLIFIED file

I think for the next step I will try to reduce the xorg.conf.new file's contents until PTB works with it in place.

I made a copy of xorg.conf.new called `xorg.conf.new.SIMPLIFIED`. I removed (commented out) many sections, then saved, copied it to `/etc/`, and renamed it as `xorg.conf`, and finally rebooted.

Limited success

RESULT: VBLSyncTest ran! This means that there was something in the original `xorg.conf.new` file that was causing the errors, and not necessarily the display mode information.

Next, I need to try inserting the display mode information into the file. But first, because it's similar, I'm going to try setting the monitor using `xrandr` from the command line, with `xorg.conf.new.SIMPLIFIED` in place.

RESULT: Interesting. xrandr did change the resolution to 800×600. However, PTB gave nothing but Sync errors for VBLSyncTest and GarboriumDemo (it wouldn't display them); but PTB did at least show the splash screen, which I didn't see at all last Friday (today is Monday). Then I used the GUI "Settings" to change the display to 1280×1024 at 90Hz – a setting that apparently comes with the monitor or something, because I didn't specify it anywhere. PTB ran! GarboriumDemo just showed a solid white screen, but VBLSyncTest worked successfully. ImagingStereoDemo worked and the flicker was higher frequency and thus less noticeable than last week when I ran it at 75 or 85 Hz (whatever the default for 1600×1200 is). Semi-yay!

Next, I'm going to try using xrandr to set the resolution to 1284×768 and 120Hz, just to see if that works whereas 800×600 didn't. Not sure why it would succeed, but seems worth a try.

RESULTS: Same pattern of results as with 800×600 at 120Hz. I guess I'll have to try editing `xorg.conf.new.SIMPLIFIED` again, perhaps adding more things from the boots PC's xorg.conf file, which is the only model I have for one that worked.

Next: wait, change of plans! While looking through VPixx's example xorg.conf files, I read that there exits "Psychtoolbox XOrgConfCreator"! I'm going to try that.

2023-10-10 notes

PTB XOrgConfCreator.m

I got `VBLSyncTest` and `ImagingStereoDemo(1,1)` to work in 1284×768 at 120Hz!

I used PTB's `XOrgConfCreator` function to create an xorg.conf file. It created the file

```
.Psychtoolbox/XorgConfs/90-ptbconfig_single_xscreen_amdgpu.conf
```

and (I think?)

```
/etc/X11/xorg.conf.d/90-ptbxorg.conf
```

I tried running PTB with this in place; same problems as above.

Modified version of PTB-generated xorg.conf file

Then I made a modified version of the file:

```
~/lab/equipment/stereopsis/CRT/90-
ptbconfig_single_xscreen_amdgpu_MODIFIED.conf
```

I copied this to `/etc/X11/xorg.conf.d/.`, and appended a string to the other `.conf` file already there so that it wouldn't be recognized as a .conf file (which, I suspect, is what gets the file read during init.). The other file is now named `90-ptbxorg.conf.CHANGEME`

Success!

Then I switched the display resolution using the GUI; it might have been to *1024*x768 instead of to *1284*x768, but it was definitely 120Hz (well, very close to that). And everything worked!

(However, NOTE: GarboriumDemo was strangely dark – low brightness.)

I just checked ~/lab/equipment/stereopsis/CRT/90-
ptbconfig_single_xscreen_amdgpu_MODIFIED.conf; it **does** specify 1024, not 1284. I guess that was the problem – I had misread my boots PC example xorg.conf file as saying 1284?

GPU not producing frame sequential stereo

2023-10-12 notes

The LCD glasses have only been working for a brief time, and it turns out that PTB had been throwing errors while the stereo presentation was happening.

I am going to try to install a different driver for the graphics card. First, I am documenting the current

state of the gpu's driver, and the PTB errors.

Checking AMD driver

[Checking AMD driver](#)

PTB errors

[PTB errors](#)

2023-10-13 notes

Installing new amdgpu driver from AMD website

Backing up root partition

Backing up up the root partition prior to installing a new amd gpu driver for the Radeon RX 580.

The output below includes (last two lines) the Sandisk USB-C drive that I will use to back up the root partition. I guess I must have made the 77G partition so that I could dd grogu's root partition onto it uncompressed. That actually seems inefficient, since it probably wouldn't take that long to compress the dd output into a .img.gz file that would be significantly smaller.

```
anthony@grogu:~$ df -h
Filesystem      Size  Used Avail Use% Mounted on
tmpfs           1.6G  2.0M  1.6G   1% /run
/dev/nvme0n1p4   77G   20G   53G  28% /
tmpfs           7.8G     0  7.8G   0% /dev/shm
tmpfs           5.0M  4.0K  5.0M   1% /run/lock
/dev/nvme0n1p5  290G  2.9G  273G   2% /home
/dev/nvme0n1p1  496M   44M  453M   9% /boot/efi
tmpfs           1.6G  104K  1.6G   1% /run/user/1000
/dev/sdb2        36G   24K   34G   1% /media/anthony/4f41a542-5fff-4140-b640-
deddb7ebf068
/dev/sdb1        77G   24K   73G   1%
/media/anthony/85617021-8551-4ce1-8e99-519ad5db3788
```

I will go ahead and just dump the partition uncompressed into the larger partition of the Sandisk USB-C drive. I just verified the the two partitions are exactly the same size by doing df without the -h flag.

Usually the "of" argument would be a file, but because the USB drive partition is exactly the same size as the input partition, it seems like there wouldn't be any room left for file information (name, etc.). So I could try making the partition itself, without a file, the "of".

I'm concerned this could backfire, so I'm just going to compress the output into a file after all.

```
$ sudo bash -c 'dd if==/dev/nvme0n1p4 | gzip >
/media/anthony/85617021-8551-4ce1-8e99-519ad5db3788/grogu_root.img.gz'
```

Result: process took 15 minutes (no rounding). Output file is 11GB.

Copied the output file (`grogu_root.img.gz`) to a new dir I just made on the 3 TB storage HDD that is currently mounted at *media/anthony/data11*.

```
$ sudo cp -p
/media/anthony/85617021-8551-4ce1-8e99-519ad5db3788/grogu_root.img.gz
/media/anthony/data11/grogu/.
```

Came to my senses! Renamed `grogu_root.img.gz` to `grogu_root_2023-10-13.img.gz` in both instances.

Download AMD driver

Download from this site:

https://www.amd.com/en/support/graphics/radeon-500-series/radeon-rx-500-series/radeon-rx-580

Select

```
Radeon™ Software for Linux® version 23.20 for Ubuntu 22.04.3
Revision Number
23.20
File Size
14 KB
Release Date
9/6/2023
```

and read instructions from here:

https://amdgpu-install.readthedocs.io/en/latest/

<2023-10-13 12:55>

Did:

```
$ amdgpu-install -y --accept-eula
```

Therefore, installed proprietary components.

Check driver after installing version downloaded from AMD

Current Datapixx.mex

I copied

```
/usr/share/VPixx Software Tools/Software
Tools/DatapixxToolbox_trunk/mexdev/build/octave/linux64/Datapixx_octave5.mex
```

to

```
/usr/share/psychtoolbox-3/PsychBasic/Datapixx.mex
```

and then made a symlink from that to Datapixx_octave5.mex.

In /usr/share/psychtoolbox-3/PsychBasic/,

```
ll Datapixx*mex
```

gives:

```
lrwxrwxrwx  1 root root    20 Oct  5 13:03 Datapixx.mex -> Datapixx_octave5.mex
-rw-r--r--  1 root root 1694640 Oct  5 11:27 Datapixx_octave5.mex
```

Altered xorg.conf file

I tried running the WIC study script, `ClusterCircle.m`, to see how it might run on this system. It couldn't paint the dots green. I thought that maybe the depth in bits parameter that PTB set when I ran `XOrgConfCreator.m` might have messed with the gpu's ability to portray color correctly (at least in PTB?), so I generated a new xorg.conf using `XOrgConfCreator` and examined it. It was minimal, but it lacked the line specifying `DefaultDepth 30`. So, I commented that line out of the xorg.conf file that I'm currently using. Then I rebooted the system, and `ClusterCircle.m` ran fine, showing green dots when it should have.

While I was at it, I removed the copy of the xorg.conf file in the critical directory (`/etc/X11/xorg.conf.d/`) and replaced it with a link to the copy of the file in `~/lab/equipment/stereopsis/CRT`. That latter directory is part of a git repo, so now I won't have to worry about version control for a separate copy.

The name of the file and the location of the link that actually matter for controlling the CRT:

```
/etc/X11/xorg.conf.d/90-ptbconfig_single_xscreen_amdgpu_MODIFIED.conf
```

Again, the above is now a *link*, no longer a file.

Trying one more thing with drivers

```
$ sudo apt install firmware-amd-graphics libgl1-mesa-dri libglx-mesa0 mesa-
vulkan-drivers xserver-xorg-video-all
```

From: https://wiki.debian.org/AtiHowTo#Firmware

Got this message:

```
Package firmware-amd-graphics is not available, but is referred to by another
package.
This may mean that the package is missing, has been obsoleted, or
is only available from another source

E: Package 'firmware-amd-graphics' has no installation candidate
```

Summary: nothing needed to be installed, except for something not found.

Summary of important files for making the 3DPixx work

```
/etc/X11/xorg.conf.d/90-ptbconfig_single_xscreen_amdgpu_MODIFIED.conf
    [or whatever file in that dir. that ends in *.conf, apparently]

/usr/share/psychtoolbox-3/PsychBasic/Datapixx.mex
    [Need to copy one of several Datapixx*.mex files to this location and
rename it "Datapixx.mex"]
    [Currently: Datapixx.mex -> Datapixx_octave5.mex]
    [Datapixx_octave5.mex was originally copied from /usr/share/VPixx Software
Tools/Software
Tools/DatapixxToolbox_trunk/mexdev/build/octave/linux64/Datapixx_octave5.mex]

[amdgpu driver files]
```

Summary of this week's work: Need to contact VPixx

I couldn't fix the PTB problems by installing the different driver.

My next plan is to contact VPixx about this, giving them information from the things I've copied and pasted above and on other pages.

Future Plans

- Try using PTB with MATLAB instead of Octave
- Try AMDGPU-PRO driver

Installing PTB in MATLAB

2023-10-16 notes

http://psychtoolbox.org/download#Linux

The instructions included adding NeuroDebian repository to apt sources list. I chose the option that included non-free software sources.

[PTB-matlab installation command output messages](#)

PTB Errors

VBLSyncTest Errors

Seems like it was nothing but errors :(

Here is the very end of the output. (I had escaped out of the demo only a second or so after it started.)

```
PTB-WARNING: Flip 212 for window 10 didn't use pageflipping for flip. Visual
presentation timing and timestamps are likely unreliable!
PTB-WARNING: Something is misconfigured on your system, otherwise pageflipping
would have been used by the graphics driver for reliable timing.
PTB-WARNING: However, if you see this message only sporadically, this might be
caused by onscreen popup messages a la "You have new mail!" or
PTB-WARNING: "New updates are ready to install" etc. Being low on free system
memory can cause this as well, especially on integrated graphics chips.
PTB-WARNING: Read the Linux specific section of 'help SyncTrouble' for some
other common causes and fixes for this problem.

INFO: PTB's Screen('Flip', 10) command seems to have missed the requested
stimulus presentation deadline
INFO: a total of 151 times out of a total of 152 flips during this session.
```

Whoa, the display even seems to have switched back from 1024×768@120Hz to 1600×1200@75Hz on its own accord after that last demo, too!

For MATLAB, have to kill VPixx background process that is often (always?) running in background before doing the following, in order to get stereo scrips to work:

```
$ ps aux | grep -i vpix  [note the ps number]
$ sudo kill [vpixx ps number]
```

```
>> isReady = Datapixx('Open')
```

will work

Fixed VBLSyncTest Errors

Turns out I think the problem was that I still had Octave open and running PTB. I think the Datapixx was being counted as open in Octave, and therefore couldn't be counted as open in MATLAB, somehow. This is based on the error message I kept getting for `Datapixx('Open')`.

In any case, the VBLSyncTest errors went away after I closed Octave, and did `Datapixx('Open')` in MATLAB.

ImagingStereoDemo(1,1) and HolesCrowd_PTB_TEST errors

Got the same problems as I have been having with Octave. `ImagingStereoDemo(1,1)` worked nicely once, but not again after that.

Namely, kept getting this error with both scripts:

```
PTB-INFO: Your script requests use of frame-sequential stereo, but your
graphics card
PTB-INFO: and driver doesn't support this. I will now fully enable the imaging
pipeline
PTB-INFO: and use my own home-grown frame-sequential stereo implementation.
Note that this
PTB-INFO: may not be as robust and high-performance as using a graphics card
with native
PTB-INFO: frame-sequential stereo support. But let's see what i can do for
you...
```

That is, PTB switches the stereo mode to mode 11.

CONCLUSION: I guess I'll move on to installing the AMDGPU-PRO driver now.

Installing AMDGPU-PRO driver

I find it a little confusing to find this driver. There doesn't seem to be a reference to download something called "amdgpu-pro" as a driver or package, but the AMD website https://www.amd.com/en/support/linux-drivers does talk about "AMD Radeon PRO graphics." Also, an ArchLinux site (https://aur.archlinux.org/pkgbase/amdgpu-pro-installer) has a page for a package called "amdgpu-pro-installer," but it's in a format (https:*.git) I'm not familiar with. The good page https://linuxconfig.org/amd-radeon-ubuntu-20-04-driver-installation, in its "Proprietary AMDGPU-PRO drivers" section, simply points to the AMD drivers download page.

Downloading .deb file from "Linux® Drivers for AMD Radeon™ PRO Graphics" official site

Under the encouraging heading "Pro Driver."

File is

```
amdgpu-install_5.5.50503-1_all.deb
```

Then, from the AMD site's instructions:

```
$ cd ~/Downloads
# For Ubuntu:
$ sudo apt-get install ./amdgpu-install-VERSION.deb
$ sudo apt-get update
```

After doing that, this script is available:

```
anthony@grogu:Downloads$ which amdgpu-install
/usr/bin/amdgpu-install
```

Did this:

```
$ amdgpu-install --usecase=workstation -y --vulkan=pro --opencl=rocr,legacy
```

I accepted the License Agreement from the terminal.

Got this error message:

```
Some packages could not be installed. This may mean that you have
requested an impossible situation or if you are using the unstable
distribution that some required packages have not yet been created
or been moved out of Incoming.
The following information may help to resolve the situation:

The following packages have unmet dependencies:
 amdgpu : Depends: amdgpu-lib (= 1:5.5.50503-1620033.22.04) but
1:5.7.50700-1646729.22.04 is to be installed
E: Unable to correct problems, you have held broken packages.
```

Solution: Turns out I had a newer version of the amdgpu-install* package already in the ~/Downloads dir. (*5.7* instead of *5.5*), so I just repeated the process using that one. No more errors.

Going to reboot and try Octave and then MATLAB PTB again.

(2023-10-16 16:17)

White Screen of Error

Got an all-white screen, and unable to do anything other than move mouse pointer, after logging back in (i.e. the login screen was normal, and I typed my password first).

Used `ctrl-alt-F1` to get to a TTY terminal, then did

```
$ less .bash-history
```

to see the recent amdgpu-install command.

Tried redoing that a few times in different ways and rebooting again, no difference.

Now I'm going to try doing

```
amdgpu-uninstall
```

Looks scary, though, so I said no the first time, decided to look up more info.

Did

```
amdgpu-uninstall
```

Perhaps unsurprisingly, got zero graphics (black screen) when rebooted.

Did

```
$ amdgpu-install -y --usecase=graphics --accept-eula
```

Then

```
$ sudo apt update
```

(actually, I'd been doing that after every time I ran an amdgpu-install command above)

The AMD drivers site instructions calls this the "All-Open Variant"

Got same problems/errors as before trying to install pro version of driver. But at least I can see the screen again.

OK, last thing to try for today:

```
amdgpu-install -y --usecase=workstation --accept-eula, but after doing amdgpu-
```

```
uninstall first
```

Got White Screen of Error again!

OK, for reals last thing to try for today:

Followed the advice from this page:

https://askubuntu.com/questions/1451506/how-to-make-ubuntu-22-04-work-with-a-radeon-rx-7900-xtx/1451852#1451852

firmware updating advice commands

Didn't help :(

2023-10-17 notes

Installing OEM kernel for Linux

OK, yesterday I didn't do step #1 of the instructions listed on the page referenced immediately above. It is this, and I'm going to do it now:

```
Install the latest OEM kernel available by running the command:

sudo apt install linux-oem-22.04c
```

BUT FIRST, note the current kernel:

```
$ uname -a
$ Linux grogu 6.2.0-34-generic #34~22.04.1-Ubuntu SMP PREEMPT-DYNAMIC Thu Sep
7 13:12:03 UTC 2 x86_64 x86_64 x86_64 GNU/Linux
```

Did it.

Some error messages came up while it was running.

After rebooting, still White Screen.

Performing steps 2 through 4 from above, again.

Still White Screen.

Tried logging in to root shell via Rescue Mode. Then did `startx` from root command line. Did get XFCE desktop, but Octave wouldn't run. Also, couldn't set the 120Hz mode (absent) using `xrandr`, because xrandr couldn't find the `DVI-D-0` display.

Rebooted and did `amdgpu-uninstall -y` as anthony.

Then did `amdgpu-install -y —accept-eula`, rebooted, as sanity check.

No more White Screen of Error, just like previous time(s?) when I did the uninstall/install the basic version of the driver (no options) before.

No more PRB graphics card error messages!

BUT THIS TIME, WHEN I RAN PTB, NO MORE ERROR MESSAGES ABOUT THE GRAPHICS CARD!!!

I can run `ImagingStereoDemo(1,1)` and `HolesCrowd_PTB_TEST.m` without getting the PTB messages about my graphics card not providing sequential frame stereo, anymore. However, I still have **the same phenomenon/issue/problem** as before: sometimes I will get less than a minute of good stereo, but then the glasses will stop working completely. No extra message output comes from PTB after compared to before the stoppage, as far as I can tell.

ans = 0
```

See? No mention of the graphics card not providing frame-sequential something something. From the PTB output messages, it sounds like everything should have gone well.

I finally commented out the offending "SkipSyncTests" line that was at the beginning of the `HolesCrowd_PTB_TEST.m` script; made no difference other than getting rid of that warning message, I think.

Conclusion about amdgpu drivers

I conclude that installing the OEM Kernel, which did reduce the number of "Firmware missing" type warnings that I saw during the subsequent `update-initramfs` command step, must have updated the firmware or the driver or *something*, to an extent that enabled the graphics card to produce frame-sequential stereo for PTB.

Just had decent success with generic DLP-Link glasses

PTB output when I ran `HolesCrowd_PTB_TEST` and then `ImagingStereoDemo(1,1)` in succession:

PTB-INFO: This is Psychtoolbox-3 for GNU/Linux X11, under GNU/Octave 64-Bit
(Version 3.0.19 - Build date: Aug 16 2023).
PTB-INFO: OS support status: Linux 6.2.0-34-generic Supported.
PTB-INFO: Type 'PsychtoolboxVersion' for more detailed version information.
PTB-INFO: Most parts of the Psychtoolbox distribution are licensed to you
under termsof the MIT License, with
PTB-INFO: some restrictions. See file 'License.txt' in the Psychtoolbox root
folder for the exact licensing conditions.

PTB-INFO: For information about paid support, support memberships and other
commercial services, please type
PTB-INFO: 'PsychPaidSupportAndServices'.

PTB-INFO: Connected to Advanced Micro Devices, Inc. [AMD/ATI] Polaris 20 XL
[Radeon RX 580 2048SP] GPU with DCE-11.0 display engine [6 heads].
```

```
PTB-INFO: OpenGL-Renderer is AMD :: AMD Radeon RX 580 2048SP (polaris10, LLVM
16.0.6,DRM 3.54, 6.2.0-34-generic) :: 4.6 (Compatibility Profile) Mesa 23.2.0-
devel
PTB-INFO: VBL startline = 768 , VBL Endline = 824
PTB-INFO: Measured monitor refresh interval from beamposition = 8.344081 ms
[119.845433 Hz].
PTB-INFO: Will try to use OS-Builtin OpenML sync control support for accurate
Flip timestamping.
PTB-INFO: Measured monitor refresh interval from VBLsync = 8.344045 ms
[119.845955 Hz]. (50 valid samples taken, stddev=0.000423 ms.)
PTB-INFO: Reported monitor refresh interval from operating system = 8.343972
ms [119.847000 Hz].
PTB-INFO: Small deviations between reported values are normal and no reason to
worry.
PTB-INFO: Psychtoolbox imaging pipeline starting up for window with requested
imagingmode 1027 ...
PTB-INFO: Will use 8 bits per color component framebuffer for stimulus
drawing.
PTB-INFO: Will use 8 bits per color component framebuffer for stimulus post-
processing (if any).
PTB-INFO: SetDitherMode: Trying to disable digital display dithering on
display head 0.
PTB-INFO: SetDitherMode: Dithering already disabled. Skipped.
LoadIdentityClut: Used GPU low-level setup code to configure (hopefully)
perfect identity pixel passthrough.
ERROR: Invalid device for current operation
ERROR: Invalid device for current operation
libptbdrawtext_ftgl: External 'DrawText' text rendering plugin initialized.
libptbdrawtext_ftgl: Maximum number of cacheable fonts is 40, minimum number
of supported concurrent windows is 10.
libptbdrawtext_ftgl: This plugin uses multiple excellent free software
libraries to do its work:
libptbdrawtext_ftgl: OGLFT (http://oglft.sourceforge.net/) the OpenGL-FreeType
library.
libptbdrawtext_ftgl: The FreeType-2 (http://freetype.sourceforge.net/)
library.
libptbdrawtext_ftgl: The FontConfig (http://www.fontconfig.org) library.
Version Id: 21301
libptbdrawtext_ftgl: Thanks!

TB-INFO: There are still 207 textures, offscreen windows or proxy windows
open. Screen('CloseAll') will auto-close them.
PTB-INFO: This may be fine for studies where you only use a few textures or
windows, but a large number of open
PTB-INFO: textures or offscreen windows can be an indication that you forgot
to dispose no longer needed items
PTB-INFO: via a proper call to Screen('Close', [windowOrTextureIndex]); ,
e.g., at the end of each trial. These
PTB-INFO: stale objects linger around and can consume significant memory
ressources, causing degraded performance,
PTB-INFO: timing trouble (if the system has to resort to disk paging) and
ultimately out of memory conditions or
PTB-INFO: crashes. Please check your code. (Screen('Close') is a quick way to
releaseall textures and offscreen windows)

INFO: PTB's Screen('Flip', 10) command seems to have missed the requested
stimulus presentation deadline
INFO: a total of 28 times out of a total of 8399 flips during this session.

INFO: This number is fairly accurate (and indicative of real timing problems
in your own code or your system)
INFO: if you provided requested stimulus onset times with the 'when' argument
of Screen('Flip', window [, when]);
INFO: If you called Screen('Flip', window); without the 'when' argument, this
count is more of a ''mild'' indicator
INFO: of timing behaviour than a hard reliable measurement. Large numbers may
indicate problems and should at least
INFO: deserve your closer attention. Cfe. 'help SyncTrouble', the FAQ section
at www.psychtoolbox.org and the
INFO: examples in the PDF presentation in PsychDocumentation/Psychtoolbox3-
Slides.pdffor more info and timing tips.

.Dots    Mean (s)          Max (s) %>20ms   %>30ms

1000    0.017   0.033          0         0
```

There was an aliasing sort of dark line that wandered up and down during `HolesCrowd`, and something like dropped frames (frames without any stereo) during `ImagingStereoDemo`.

Next steps

Create a file based on the example in the 3DPixx manual booklet, try to run it.

Could also try installing "All Open" and "Workstation" use case versions of the amdgpu driver, now that I have installed the OEM kernel.

VPixx version of ImagingStereoDemo.m

2023-10-23 notes

Created VPixx git repo

This past weekend, created a private repo named "VPixx" on my github account (acate).

I filled it with the directory of scripts that I downloaded from the "MyVpixx" website; the directory named "psychtoolbox–datapixx_demo_OCTAVE". That is, the VPixx directory/repo contains a subdir. named "psychtoolbox–datapixx_demo_OCTAVE" which contains a bunch of octave scripts.

I am going to clone this repo onto `grogu` in the lab.

Testing the VPixx version of ImagingStereoDemo.m

The script is

```
.../Vpixx/psychtoolbox--datapixx_demo_OCTAVE/DatapixxImagingStereoDemo.m
```

Strange behavior of the system.

I could see in stereo for a few seconds, and then the glasses/system stopped working, much like it always has up to this point.

However, unlike before, the stereo started off showing uncrossed disparity (concave in the demo) for which the absolute disparity shrank gradually until the disparity became crossed (convex) until the perceived depth was too great to perceive any more. Then the glasses/system quit working.

I couldn't get the demo to work again, because I kept getting "Datapixx is not open" type errors, and then more errors when I tried the "Datapixx('Open')" command. However, unlike before, those error messages were accompanied by the message "unable to connect to server". I Googled that with the term Datapixx, and found that there is something called a "device server" (see https://vpixx.com/developer/VPixx_Software_Tool_Update_Guide_3R5.pdf p. 2) that has to be running, according to the page I saw. I'm not sure about whether this is completely necessary, but I followed the advice I saw and did:

```
sudo systemctl start vpixx-device-server
```

... and this allowed the command

```
Datapixx('Open')
```

to work again.

However, even though I was able to get `DatapixxImagingStereoDemo` to work again, it worked similarly to the first time, but with a flipped sign of disparity: it started off displaying a (fairly shallow) crossed disparity (convex) bump, which then shrank until the Gaussian region became more and more strongly uncrossed disparity, until the disparity became too large, and then the glasses/system quit working again.

OpenGL info

glxgears output

Do this on command line as a way of testing OpenGL:

```
glxgears
[then]
glxgears -info
```

```
Running synchronized to the vertical refresh.  The framerate should be
approximately the same as the monitor refresh rate.
657 frames in 5.0 seconds = 131.242 FPS
X connection to :0.0 broken (explicit kill or server shutdown).
```

```

glxinfo output

Output is rather long, so follow this link to see it:

glxinfo output

Next steps

- Try downloading the VPixx scripts, but the versions for MATLAB instead of for Octave. Then run the same demos.

- Finally email Vpixx.

Ran PsychLinuxConfiguration

2024-01-22

Ran it on octave command line (i.e. no gui), as sudo.

Not sure whether I had run it before.

Tried ImagingStereoDemo again

Mostly successful! Only qualified by the following error/warning messages.

I ran octave from the command line as a regular user.

[Can't copy text for some reason; will try pasting screenshot]

Package update problem after rebooting on 2024-01-22

I tried `sudo apt update` and `sudo apt upgrade`, but still get:

```
You might want to run 'apt --fix-broken install' to correct these.
The following packages have unmet dependencies:
 libgl1-amdgpu-mesa-dri : PreDepends: mesa-amdgpu-va-drivers (=
1:23.2.0.50700-1646729.22.04) but 1:23.2.0.50702-1683306.22.04 is installed
                          Recommends: libtxc-dxtn-s2tc0 but it is not
installable or

                               Recommends: libtxc-dxtn-s2tc0:i386 but it is
not installable or
                                           libtxc-dxtn0:i386 but it is not
installable
 mesa-amdgpu-va-drivers : Depends: libllvm16.0.50702-amdgpu but it is not
installed
 mesa-amdgpu-va-drivers:i386 : Depends: libllvm16.0.50702-amdgpu:i386 but it
is not installed
E: Unmet dependencies. Try 'apt --fix-broken install' with no packages (or
specify a solution).
```

Do `sudo apt —fix-broken install` doesn't help:

```
anthony@grogu:~$ sudo apt --fix-broken install
